Initiation

Gap Analysis

JDN Pharmacy, located along Burgos Avenue in Bacolod City, currently relies on manual inventory tracking to manage its stock of medicines. Staff record incoming and outgoing supplies by hand, verify expiration dates manually, and monitor reorder levels without automated support. This traditional approach has led to several operational challenges that affect efficiency, accuracy, and customer service.

Inventory records are fragmented and dependent on staff diligence. Because of this, inconsistencies occur in stock counts, and decision-making is often delayed. When medicines are frequently dispensed, staff cannot quickly determine current stock levels or identify which items are nearing depletion. This increases the risk of stockouts, overstocking, or overlooking expired medicines.

Manual monitoring also makes it difficult to generate timely reports for management. Without a centralized system, pharmacy staff spend significant time preparing summaries of available stock, which slows down planning and reduces responsiveness to customer demand.

Handwritten records are vulnerable to human error and data loss. Once records are misplaced or damaged, there is no backup copy of inventory transactions. This undermines accountability and makes it difficult to track medicine demand or supplier performance.

The absence of a digital system prevents the pharmacy from scaling operations and adapting to modern customer expectations. Staff productivity is reduced because more time is spent on manual record-keeping instead of focusing on customer service.

Because of these problems—fragmented records, delayed reporting, risk of data loss, and inefficiency in monitoring stock levels—there is a clear need to develop a web-based Inventory Management System for JDN Pharmacy.

Project Title

Inventory Management System for JDN Pharmacy

Scope and Delimitation

Scope

This study focuses on developing a web-based Inventory Management System for JDN Pharmacy. The system will allow staff to register medicines, monitor stock levels, track expiry dates, record dispensing transactions, and generate basic reports. It will provide a centralized digital repository accessible across devices, designed to improve accuracy, efficiency, and reliability in managing pharmacy inventory. The system also includes role-based access control that distinguishes between administrator and staff permissions, as well as modules for managing drug categories, supplier information, and system user accounts. Automated alerts for low-stock and expiring medicines will be provided to support timely decision-making by pharmacy management.

Delimitation

The study is limited to inventory tracking for a single branch of JDN Pharmacy. It excludes advanced features such as automated purchase order generation, integration with point-of-sale systems, or native mobile application development. Financial accounting and billing modules are also not within scope.

General Objective

The primary goal of this research is to develop a web-based Inventory Management System that will streamline pharmaceutical stock management and improve operational efficiency at JDN Pharmacy, reducing manual workload, minimizing human error, and supporting informed decision-making through accurate and real-time inventory data.

Specific Objectives

1. To develop a centralized web-based repository that records and monitors medicine stock levels, including expiry dates and reorder points, ensuring that inventory data remains accurate, consistent, and accessible to authorized users at all times.
2. To design a complete medicine management module that supports the addition, updating, and removal of drug records—including details such as name, generic equivalent, SKU, category, dosage form, supplier, unit cost, and controlled substance flags—ensuring that inventory data remains accurate and up to date.
3. To implement an automated expiry monitoring and alert system that classifies drugs by urgency status and notifies staff of expired, critically expiring, and low-stock medicines without requiring manual checking, reducing the risk of dispensing expired or unavailable medicines.
4. To build a dispense logging module that records every drug dispensing transaction with details such as drug name, quantity dispensed, dispensing staff, and timestamp, and

automatically deducts the dispensed quantity from the live inventory to maintain accurate stock levels.

5. To evaluate the system's usability and effectiveness through structured User Acceptance Testing (UAT) conducted with actual pharmacy staff, using the gathered feedback to validate that the system meets operational needs and to make necessary improvements prior to final deployment.

Schematic/Conceptual Framework

Input–Process–Output–Outcome (IPOO) framework of the proposed Pharmacy Inventory system, showing how stakeholder needs and existing operational practices are processed through system development phases.

Figure I. Conceptual Framework

Phase II

PLANNING

Feasibility Analysis

Technical Feasibility

The proposed Inventory Management System for JDN Pharmacy can be developed using PHP and MySQL, deployed through XAMPP, and coded with Visual Studio Code on a Windows environment. The system is designed to run on standard hardware specifications, such as a dual-core 2.0 GHz processor, 4 GB RAM, and SSD storage, without requiring hardware upgrades.

DEVELOPMENT REQUIREMENT

Hardware Requirements		
Hardware	Specification	Cost
PC/Monitor	19" LED Monitor for POS	₱ 9,500.00
Keyboard & Mouse	Standard Wired Combo	₱ 350.00
TOTAL COST:		₱ 26,050.00
Software Requirements		
Software	Specification	Cost
Operating System	Windows 11 Home (Licensed)	₱ 7,500.00
Office Software	Microsoft Office Home 2021	₱ 7,000.00
Database Software	MySQL / PHPMyAdmin (Open Source)	₱ -
Web Server	XAMPP (Apache + PHP)	₱ -
Antivirus	Windows Defender (Built-in)	₱ -
TOTAL COST:		₱ 14,500.00
Network/Communication Requirements		
Requirement	Specification	Cost
Internet Connection	Fiber 50–100 Mbps	₱ 1,699.00
Router	Basic TP-Link WiFi Router	₱ 1,750.00
TOTAL COST:		₱ 3,449.00

People Requirements		
Role	Description	Cost
System Developer	Developes and test the system	₱ 24,000.00
System Maintenance Staff	Maintains and fix system errors	₱ 7,000.00
<u>Database Administrator</u>	<u>Manages data and records</u>	₱ <u>5,000.00</u>
TOTAL COST:		₱ 36,000.00
TOTAL: ₱ 79,999.00		

Figure 2. Developmental Requirements

Developmental Feasibility

Figure 3 shows the implementation requirements for JDN Pharmacy's Inventory Management System. The project will use PHP/MySQL with XAMPP and Visual Studio Code on Windows. Standard hardware (Intel i5, 8GB RAM, 512GB SSD) and licensed software are sufficient. Key activities—installation, training, data entry, and testing—fit within the three-month development period, ensuring smooth deployment with available resources.

IMPLEMENTATION REQUIREMENTS

Hardware Requirements		
Hardware	Specification	Cost
Processor(CPU)	Intel Core i5 (10th Gen or higher)	₱ 8,000.00
Memory(RAM)	8GB DDR	₱ 2,000.00
Storage(SSD)	512GB SSD	₱ 3,000.00
Motherboard	Compatible Intel Motherboard	₱ 5,000.00
PC/Monitor	19" LED Monitor for POS	₱ 9,500.00
Keyboard&Mouse	Standard Wired Combo	₱ 350.00

Figure 3. Implementation Requirement

Operational Feasibility

Figure 4 shows the system's operational requirements, which are designed to address the current challenges of manual inventory tracking by providing a centralized digital repository for medicine records, stock monitoring, and expiry date tracking. Pharmacy staff will benefit from faster access to inventory data, reduced errors, and improved reporting capabilities. Since the system is user-friendly and tailored to the workflow of JDN Pharmacy, it can be adopted with

minimal disruption to daily operations. Training sessions will ensure that staff can effectively use the system, thereby enhancing productivity and customer service.

OPERATIONAL REQUIREMENTS

Operations	Unit	Quantity	Cost
Electricity	₱ 800.00	12	₱ 9,600.00
Internet	₱ 1,699.00	12	₱ 20,388.00
Software Maintenance	₱ 1,000.00	12	₱ 12,000.00
Hardware Maintenance	₱ 1,000.00	12	₱ 12,000.00
TOTAL COST:			₱ 53,988.00

Figure 4. Operational Feasibility

Tangible and Intangible Benefits

Figure 5 presents the benefits of the Inventory Management System for JDN Pharmacy, highlighting both measurable and non-measurable gains. Tangible improvements include faster prescription processing, streamlined staff alerts, and real-time inventory tracking, while intangible outcomes cover enhanced customer satisfaction, better staff support, and improved decision-making. Together, these benefits emphasize the strategic value of adopting the digital platform and justify the investment in transitioning from manual processes to a modern, web-based system.

OPERATIONAL BENEFITS	
Tangible	Cost
Faster prescription processing	₱ 30,000.00
Streamlined doctor/patient alerts	₱ 25,000.00

Real-time Inventory Tracking	₱
	40,000.00
TOTAL COST:	₱
	95,000.00
Intangible	Cost
Increased patient satisfaction	₱
	20,000.00
Better patient counseling & tracking	₱
	15,000.00
Enhanced professional image	₱
	10,000.00
<u>Improved inventory decision-making</u>	<u>₱</u>
	<u>8,000.00</u>
TOTAL COST:	₱
	53,000.00

Figure 5. Benefits

Economic Feasibility

Figure 6 illustrates the payback analysis, providing a framework for determining the financial viability of the Inventory Management System for JDN Pharmacy. The comparison of cumulative costs and benefits across five years shows how the initial investment is gradually recovered. By pinpointing when benefits exceed expenses, the analysis clarifies the timeline for cost recovery and highlights the overall return on investment from implementing the system.

Payback Analysis Year	Cost	Cumulative Cost	Benefits	Cumulative Cost	
			0	175,799.00	175,799.00
1	₱	53,988.00	₱	229,787.00	148,000.00
					148,000.00
2	₱	57,767.16	₱	287,554.16	155,400.00
					303,400.00
3	₱	58,307.04	₱	345,861.20	152,440.00
4	₱	55,607.64	₱	401,468.84	156,880.00
					612,720.00
5	₱	55,067.76	₱	456,536.60	153,920.00
					766,640.00

Figure 8. Gantt Chart

Figure 9. SDLC Model

Requirements Phase

In this phase, the researchers analyzed the existing manual inventory management workflows of JDN Pharmacy, located along Burgos Avenue in Bacolod City. The flow of information among pharmacy staff, suppliers, and management was examined to identify inefficiencies, bottlenecks, and data management issues. Specific problems identified included fragmented inventory records, the risk of stockouts and overstocking, difficulty in monitoring expiry dates, and the absence of timely reporting tools. The findings from this phase served as the basis for system design and feature planning.

Design Phase

During the design phase, the system architecture, database structure, and user interface layout were planned and documented. Key system modules such as the login and authentication system, medicine management, stock monitoring, expiry date tracking, dispense logging, and report generation were defined. Role-based access control distinguishing administrator and staff permissions was also incorporated into the design. The relationships among data entities were established and documented using an Entity Relationship Diagram (ERD) to ensure accurate and organized data storage.

Development Phase

This phase involved the actual coding and construction of the system based on the approved design specifications. Manual processes such as recording medicine stock levels, monitoring expiry dates, logging dispensing transactions, and generating inventory reports were converted into automated digital workflows. The system was built using PHP and MySQL, deployed through XAMPP, and coded with Visual Studio Code on a Windows environment. Features were developed incrementally across multiple sprints, following the Agile Software

Development Life Cycle (SDLC), to allow for continuous integration and testing throughout the development period.

Testing Phase

During the testing phase, the developed system was evaluated for functionality, usability, and security. Each module was tested to verify that it performed as intended, including the login and authentication system, the medicine management interface, stock monitoring and expiry alert features, the dispense logging module, and the report generation function. User Acceptance Testing (UAT) was conducted with actual pharmacy staff to gather structured feedback and validate that the system met operational needs. Defects and inconsistencies identified during testing were reported and resolved before proceeding to deployment.

Deployment Phase

After successfully passing all test cases, the system was deployed to the production environment where it became accessible to authorized pharmacy staff. The deployment was carried out in a controlled manner to minimize disruption to daily pharmacy operations and ensure system stability. User accounts were configured with appropriate role-based permissions, and pharmacy staff including the administrator were oriented on the proper use of the system through training sessions designed to ensure smooth adoption.

Review Phase

The final phase involved evaluating the completed system against the original objectives and gathering feedback from end users, particularly the pharmacy staff and administrator. System performance, usability, and overall operational efficiency were assessed. The results confirmed that the system successfully addressed the identified problems, including

(Good governance, Research-oriented, Extension-driven, Education for Sustainable Development & Nation-building)

fragmented records, delayed reporting, and manual monitoring challenges. Insights gathered during this phase were used to identify areas for further improvement and to inform subsequent development iterations, completing the Agile cycle.

User Interface

Log in Page

Figure 13 shows the Log In interface of the JDN Inventory Management System. This page acts as the system's gateway, requiring users to input their username and password for authentication. It offers two role selections — Administrator and Staff — ensuring that, upon successful login, individuals are directed to the appropriate interface based on their designated role.

Figure 13. Log In page

Dashboard

Figure 14 shows the Dashboard of the JDN Pharmacy Inventory System as accessed by the Administrator. It provides an at-a-glance view of the overall inventory, highlighting essential indicators such as available stock, items running low, and those nearing or past

expiration. The dashboard also organizes medicines by category, giving a clear picture of distribution across drug types. On the side, an alerts panel lists important notifications like expired, out-of-stock, or low-stock items, allowing quick action through direct links. This setup ensures that administrators can efficiently oversee inventory levels and maintain safe, well-managed pharmacy operations.

Figure 14. Dashboard Page

Drug Inventory

Figure 15 shows the Drug Inventory section of the JDN Pharmacy Inventory System. It lists medicines with details such as stock levels, expiry dates, and storage locations. Search and filter options, along with add, edit, and delete functions, allow administrators to manage inventory records effectively.

DRUG	SKU	CATEGORY	STOCK	PRICE	EXPIRY	FLAGS	LOCATION	ACTIONS
Amlodipine 5mg Amlodipine - Tablet	RX-AHL-005	Antihypertensive	• 190 tabs min 80	P0.22	585d 2027-08-30	Rx	Shelf B1	[Edit] [Delete]

Figure 20. Categories

Users

Figure 21 displays the Users management interface of the JDN Pharmacy Inventory System. It lists system users along with their roles, statuses, and last login details. Administrative controls for adding, editing, or removing users ensure secure access and proper role assignment.

Staff Dashboard

Figure 22 shows the Dashboard of the JDN Pharmacy Inventory System as accessed by a Staff user. It provides a simplified overview of inventory conditions, highlighting general statistics on available, low, and expired stock. A summary by category offers a quick view of distribution across different types of medicines, while the alerts panel lists important notifications that require attention. This interface allows staff members to monitor inventory at a glance and support daily pharmacy operations.
